AMENDMENTS TO THE SPECIFICATION:

Please amend the paragraph beginning on page 8, line 13, as follows:

It is preferable that the weight <u>mass</u> of the sub-frame <u>itself or the sub-frame</u> including mounted members is 1/10 - 1/3 of the whole <u>mass</u> weight of the main frame including mounted members so as to suppress <u>vibration of</u> the main frame at a high speed rotation of the disc, from a point of view of the positional limitation of respective component members. <u>Of course, even if nothing is mounted on the sub-frame, it is possible to obtain the effect of suppressing the vibration of the <u>main frame</u>.</u>
